

CR8W Dashboard Developer & Operations SOP

For Monica Blanco (Monny) and future Create Well dev team

Last updated: August 2026 | Applies to: <https://cr8w.com>

CR8W Dashboard — Developer & Operations SOP

For: — Monica Blanco (Monny) and future Create Well dev team

Last updated: — August 2026

Applies to: — <https://cr8w.com>

1. Quick Reference (Bookmark These)

What	URL	Password / Token
Live Dashboard	https://cr8w.com	Profile: monny / sunshine / bingle / omar / pia
Vercel Dashboard	https://vercel.com/monnylog/cr8w_home_v2	Google login (monica.istorya@gmail.com)
Supabase Dashboard	https://supabase.com/dashboard/project/axntibrdivccycxdwlzk	Google login
Notion Workspace	https://www.notion.so/hello-takehome-studio	hello@takehome.studio
GitHub Repo	https://github.com/create-well/CR8W_home_v2	—
Google Drive	https://drive.google.com/drive/folders/1d9OyYZusS0yyYsfwtjLkz1ss0KYPzI5a	monica.istorya@gmail.com

Important tokens (DO NOT share outside core team):

- Notion integration token: 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
- Supabase project ref: axntibrdivccycxdwlzk
- Vercel project ID: prj_KMc00vxHpX0v9rbP87p031ruwZIK

2. How to Access the Dashboard

1. Open <https://cr8w.com> in any browser
2. Click your profile name:
 - monny → full core access
 - sunshine → full core access
 - bingle → full core access
 - omar → full core access
 - pia → co-creator access (Hub, Workshops, Well only)
3. That's it. No password. The dashboard loads your role automatically from Supabase.

3. How to Trigger a Notion Sync

Option A: Click the button (easiest)

1. Open <https://cr8w.com>
2. Click the **Sync** button in the top-right nav bar (between  and the green dot)
3. Wait ~5-10 seconds
4. The sync dot turns green = success, red = error

Option B: Let it run automatically

- Sync runs every ~30 minutes automatically (cron job on Supabase)
- The sync dot in the nav shows the last sync time on hover

Option C: Run manually via command line

```
curl -X POST 'https://axntibrdivccycxdwlzk.supabase.co/functions/v1/sync-to-notion' \ -H 'Content-Type: application/json' -d '{}'
```

```
curl -X POST 'https://axntibrdivccycxdwlzk.supabase.co/functions/v1/sync-from-notion' \ -H 'Content-Type: application/json' -d '{}'
```

4. How to Update the Dashboard (For Beginners)

If you need to change text, colors, or layout:

Step 1 — Open the code

```
# On Monica's Mac, the project lives here: cd /Users/monicablanca/Desktop/createwell/CR8W_home_v2
```

Step 2 — Edit the file you need

To change...	Edit this file...
Nav bar text, sync button, profile dropdown	<code>src/components/TopNav.tsx</code>
Which views exist and their order	<code>src/App.tsx</code> (lines 24-32)
Hub page layout	<code>src/views/HubView.tsx</code>
Podcast page	<code>src/views/PodcastView.tsx</code>
Workshops + applicants	<code>src/views/WorkshopsView.tsx</code>
The Well (forum + notes)	<code>src/views/WellView.tsx</code>
CoFlow check-ins	<code>src/views/CoFlowView.tsx</code>
Team / collaborators	<code>src/views/TeamView.tsx</code>
Revenue pipeline	<code>src/views/RevenueView.tsx</code>
Colors, fonts, spacing	<code>src/index.css</code> (design tokens at top)
API calls to backend	<code>src/api.ts</code>

Step 3 — Build to check for errors

```
cd /Users/monicablanca/Desktop/createwell/CR8W_home_v2 npm run build
```

If it says "✓ built in Xms" — you're good.

If it shows errors — read the error message, fix the file, try again.

Step 4 — Deploy

```
npx vercel@latest --prod --yes
```

Wait ~20 seconds. The URL <https://cr8w.com> updates automatically.

5. How to Access the Supabase Backend (Database)

Option A: Web Dashboard (easiest, visual)

1. Go to <https://supabase.com/dashboard/project/axntibrdivccycxdwlzk>
2. Log in with Google (monica.istorya@gmail.com)
3. Use the left sidebar:
 - **Table Editor** → browse/edit data like a spreadsheet
 - **SQL Editor** → run custom queries
 - **Database** → view tables, relationships, RLS policies
 - **Edge Functions** → view/deploy serverless functions
 - **Logs** → see what happened, debug errors

Option B: SQL Editor (for quick changes)

1. In Supabase dashboard → SQL Editor
2. Write your query, click Run
3. Examples:

```
-- View all podcast episodes SELECT * FROM episodes ORDER BY episode_num; -- View all workshops SELECT *  
FROM workshops ORDER BY date; -- View revenue opportunities SELECT * FROM revenue_ops ORDER BY  
expected_close; -- Check who has access SELECT username, role FROM profiles;
```

Option C: Edge Functions (for code-level backend changes)

1. In Supabase dashboard → Edge Functions
2. See the list: sync-to-notion, sync-from-notion
3. Click one to view its code
4. To edit: download, modify, then redeploy (see Section 7)

6. Notion Databases — What Lives Where

The dashboard syncs bidirectionally with these Notion databases in the `hello@takehome.studio` workspace:

Notion Database	Supabase Table	What it holds
CR8W Podcast Episodes	episodes	Episode topics, guests, status, dates
CR8W Guests	guests	Guest names, contact, stage, prep notes
CR8W Topic Drops	topic_drops	Ideas for podcast topics, votes, gut checks
CR8W Workshops	workshops	Workshop titles, dates, facilitators, status
CR8W Applicants	applicants	Workshop applicants, vetting stage, source
CR8W Revenue Opportunities	revenue_ops	Sponsors, grants, donors, pipeline stage
CR8W CoFlow Check-ins	coflow_checkins	Weekly check-in data for meetings

How to edit in Notion:

1. Open <https://www.notion.so>
2. Log in as `hello@takehome.studio`
3. Find the relevant database
4. Edit cells like a spreadsheet
5. The next auto-sync (or manual  click) pushes changes to the dashboard

7. How to Deploy / Update Edge Functions

Edge Functions are the serverless code that runs on Supabase (like the Notion sync).

Step 1 — Edit the function

```
# Function files live here: cd
/Users/monicablanc/Desktop/createwell/CR8W_home_v2/supabase/functions/sync-to-notion # or
supabase/functions/sync-from-notion
```

Step 2 — Deploy

```
# Using Supabase CLI (if installed) supabase functions deploy sync-to-notion supabase functions deploy
sync-from-notion # Or using the MCP / dashboard: # Go to Supabase Dashboard → Edge Functions → Deploy
```

Verify deployment:

```
curl -X POST 'https://axntibrdivccycxdwzlk.supabase.co/functions/v1/sync-to-notion' \ -H 'Content-Type:
application/json' -d '{}'
```

Should return `{ok: true, results: [...]}`

8. Local Development — Full Setup (For New Dev)

Prerequisites:

- Node.js 20+ (node --version)

- npm (comes with Node)
- Git (for cloning)

Setup:

```
# 1. Clone the repo git clone https://github.com/create-well/CR8W_home_v2.git cd CR8W_home_v2 # 2. Install dependencies npm install # 3. Create local env file cp .env.example .env.local # Edit .env.local with: # VITE_SUPABASE_URL=https://axntibrdivccycxdwlzk.supabase.co # VITE_SUPABASE_ANON_KEY=<get from Supabase dashboard → Project Settings → API> # 4. Start dev server npm run dev # Opens at http://localhost:3000 # 5. Build for production check npm run build
```

9. CRITICAL: Do Not Edit These Files

File	Why
src/utils/supabase/info.tsx	Auto-generated by Figma Make. Editing it will be overwritten on every sync. Use config.ts instead.
node_modules/	Auto-generated. Never commit.
dist/	Auto-generated build output. Never commit.
Edge Function secrets (DB IDs, tokens)	Stored in Supabase Vault, NOT in code. Access via <code>public.get_notion_secrets()</code> RPC.

10. Troubleshooting

Problem: Dashboard won't load / shows "Loading the well..." forever

Fix: — Check your internet. The dashboard needs to reach Supabase. Try refreshing.

Problem: Sync button shows red dot / "error"

Fix:

1. Check Supabase status: <https://status.supabase.com>
2. Try the manual curl command (Section 3, Option C)
3. Check Supabase Logs: Dashboard → Logs → Edge Functions

Problem: Changes I made in Notion don't show in dashboard

Fix:

1. Click  Sync button on dashboard
2. Wait 10 seconds
3. If still missing, check the Notion database name matches exactly

Problem: `npm run build` fails

Fix:

1. Read the error message carefully — it tells you the file and line
2. Common causes: missing closing tag, typo in variable name, forgot `async` keyword
3. If stuck, run `git diff` to see what changed

Problem: Figma Make sync broke the build

Fix:

1. `git diff --name-only` — see what Figma Make touched
2. Check if `.gitignore` is missing — restore it
3. Check if `src/Utils/supabase/config.ts` is missing — recreate from `info.tsx`
4. Fix imports in `src/api.ts` and `src/App.tsx`
5. `npm run build` to verify

11. Team Design Reminders

This dashboard serves humans first. When building:

- **Sunshine** needs vision seen, not hustle metrics
- **Monny** needs bridge-building tools, not output tracking
- **Bingle** needs explicit sight recognition — don't make them invisible
- **Omar** needs container held — when gear won't flow, go audio-only

The dashboard is a **flow tool**, not a surveillance tool. Build banks for the river. Don't force the architecture.

12. Emergency Contacts

What	Who / Where
Can't access dashboard	Omar (Tech Anchor) or check Vercel status
Notion sync broken	Check Supabase logs first, then ping Omar
Need new team member access	Add profile to <code>profiles</code> table in Supabase, set role
Lost Notion token	Regenerate at <code>notion.so</code> → Integrations → CR8W
GitHub repo access	Repo owner: create-well org

This document lives in the workspace at:

`/Users/monicablanco/Desktop/createwell/CR8W_home_v2/CR8W_Developer_SOP.md`
